About us

It is the corporate objective of ALCUTEC-Engineering GmbH to offer the aluminum industry sustainable technologies and strategies that are combined with the relevant commercial benefits. This approach means for us to develop and design techniques and plant components that will go even beyond the current environmental requirements, while making gentle use of the available resources and consuming as little energy as possible. This also includes the safe, reliable and trouble-free operation of the plants and a long service life of the individual plant elements.

In order to meet these requirements, ALCUTEC's activities have been broken down into three key areas:

1. The Engineering that begins with the development of a tailor-made plant strategy and covers all other details required for implementing a project.
2. Technological solutions for specific requirements that result from the general conditions of a given project. The efforts made in this respect will usually refer to constructive solutions for plant components, where ALCUTEC can rely on new and approved designs, such as the tiltable rotary kiln, while continuous development efforts will produce even better solutions that have been improved further. For certain facilities, ALCUTEC seeks the cooperation with experienced partners from the industry.
3. The service, project management and commissioning, including an effective after-sales service. Moreover, the ALCUTEC experts also offer consulting services in the field of production and manufacturing.

We also attach great importance to the good cooperation with our customers. This does not only help developing the optimal, tailor-made strategy for the actual project concerned, it will also ensure that our designs can be continuously tested and further improved. Whatever applies to the plant design and construction will also hold true for advising customers on production matters: Experts with a wealth of experience in the field of aluminum production are at the customers' disposal and can offer them help and advice should technical or organizational problems occur.
